Swelling and Swelling-
activated Currents in
Feline Ventricular
Myocytes Ramesh Gopal
1997 Feline ventricular

myocytes swell when
exposed to hypotonic
solutions. Swelling is
associated with the
appearance of an
outwardly-rectifying
transmembrane ionic
current. The whole-cell
patch-clamp
conformation, video-
microscopy and hypotonic
(180 mOsm) solutions
were used to investigate
the nature of this
current and its
relationship to myocyte
swelling. The swelling-
activated current
(I_{swell}) was
found to consist of a
cation and an anion
component. The cation
component ($I_{\text{cat-swell}}$), isolated
by using chloride-free
solutions, was
insensitive to block by
barium (0.5 mM), cesium
(10 mM) and gadolinium
(50 μM) ions, but
was blocked by
tetraethylammonium
acetate (10 mM) applied
to the inner surface of

the membrane. The anion component, recorded in potassium-free solutions, was chloride-sensitive and was designated $I_{\text{Cl-swell}}$. It was present in 50% of patched myocytes and was activated by osmotic swelling as well as by application of positive pressure to the patch pipette. When $I_{\text{Cl-swell}}$ was present the plot of current amplitude against myocyte cross-sectional area was linear, i.e. the magnitude of $I_{\text{Cl-swell}}$ increased with increasing swelling and declined during shrinking. This linear relationship was rendered non-linear by cytochalasin D (15 $\mu\text{g/ml}$) which disrupts F-actin filaments, but not by colchicine (2.5 μM) which disrupts microtubules. As

$I_{\text{Cl-swell}}$ appeared grossly similar to the cAMP-dependent chloride current ($I_{\text{Cl-cAMP}}$), myocytes were tested for responses to swelling as well as cAMP-elevating agents such as isoproterenol (1 μM) and forskolin (10 μM). Four populations of myocytes were identified: those that developed a chloride current both on swelling and cAMP elevation, those responding to only one or the other, and those responding to neither. The current activated by swelling, but not forskolin, was blocked by DIDS (100 μM) and could be activated in absence of pipette ATP and in the presence of AMP-PNP (200 μM). Based on these findings it was concluded that $I_{\text{Cl-swell}}$ and $I_{\text{Cl-cAMP}}$ are different currents

carried by different types of chloride channels. Swelling-activated currents depolarize the myocyte resting membrane potential and shorten its action potential duration. Therefore, they may contribute to cardiac arrhythmias observed in conditions associated with cardiomyocyte swelling such as ischemia, infarction and reperfusion.

Kingdoms of Life - Animals (eBook) Gina Hamilton 2006-09-01
Milliken's Kingdoms of Life series is aligned with national science standards and reflects current teaching practices. Each book includes approximately 50 black and white reproducible pages, 12

full-color transparencies (print books) or PowerPoint slides (eBooks), comprehension questions and lab activities for each unit, an answer key, a glossary of bolded terms, a timeline of biological discovery, a laboratory safety guide, as well as a national standards correlation chart. Animals details the anatomy and behavior of the kingdom with the greatest cellular complexity. It includes both many-celled and single-celled organisms (such as protozoans). Animals differ from plants in having cells without cellulose walls, in lacking chlorophyll and the capacity for photosynthesis, in requiring more complex food materials (as proteins), in being organized to a greater degree of complexity, and in having the

capacity for spontaneous movement and rapid motor responses to stimulation.

The Preparation of Solutions Isoosmotic with Blood, Tears, and Tissue C. G. Lund

2013-10-22 The Preparation of Solutions

Isoosmotic with Blood, Tears, and Tissue provides the data needed to establish rules in the formulation of extemporaneous isoosmotic eye preparations for use in the new Danish Pharmacopoeia. The book provides a large number of freezing point and vapor pressure determinations of solutions of appropriate drugs. From the data obtained, proposals were made for the correction of prescriptions relating to eye preparations in the Dispensatorium Danicum. It was also shown how isoosmotic solutions can easily be obtained for extemporaneous preparations in general. By using curves in the present work it will be possible to prepare isotonic solutions of a large number of the commonly employed remedies in

therapeutics, both for injection and for application to the eyes. They enable the pharmacist to prepare extemporaneously described fluids of the correct osmotic concentration. It is hoped that this text may also be of value to the work in other pharmaceutical laboratories in Denmark, and abroad.

reduce decay, rising concerns about toxicity have led to the development of alternative approaches to disease control, including biological methods, the subject of three chapters of this book. With several new techniques requiring modification of current post-harvest practices, it is more important than ever to stay abreast of the latest information. Other chapters deal with the mechanisms of host fruit and vegetable resistance, fungal pathogenicity factors and their relationship with the host response, and a number of subjects related to disease assessments before harvest as well as their relationship to the postharvest treatment of fruits and vegetables. The book also includes several useful case studies of crops such as

kiwifruit and peaches, where different approaches at the pre- and post-harvest levels are combined to good effect. With food production issues gaining an ever higher profile internationally, this text makes an important contribution to the debate.

Pharmaceutical Calculations: A

Conceptual Approach, is a book that combines conceptual and procedural understanding for students and will guide you to master prerequisite skills to carry out accurate compounding and dosage regimen calculations. It is a book that makes the connection between basic sciences and pharmacy. It describes the most important concepts in pharmaceutical sciences thoroughly, accurately and consistently through various commentaries and activities to make you a scientific thinker, and to help you succeed in college and licensure exams. Calculation of the error associated with a dose measurement can only be carried out after understanding the concept of accuracy versus precision in a measurement. can only come about after understanding the process of transmembrane passive diffusion. Early understanding of these concepts will allow reinforcement and deeper comprehension of other related concepts taught in other courses. More weight is placed on the qualitative understanding of fundamental concepts, like tonicity vs osmotic pressure, diffusion vs osmosis, crystalloids vs colloids, osmotic diuretics vs plasma expanders, rate of change vs rate constants, drug accumulation vs drug fluctuation, loading dose vs maintenance dose, body surface area (BSA) vs body weight (BW) as methods to adjust dosages, and much more, before considering other quantitative problems. In one more significant innovation, the origin and physical

significance of all final forms of critical equations is always described in detail, thus, allowing recognition of the real application and limitations of an equation. Specific strategies are explained step-by-step in more than 100 practice examples taken from the fields of compounding pharmacy, pharmaceuticals, pharmacokinetics, pharmacology and medicine.

Tear Osmolarity Changes After Instilling Isotonic Hyaluronate Artificial Tears Aaron Reinert 2012

Introduction. Tear hyper-osmolarity may be a fundamental cause of dry eye in many cases. Hyaluronate is an agent used in some artificial tears, which binds water and can protect against evaporation. It may therefore be an effective treatment for tear hyper-osmolarity. Purpose. Our purpose was to measure changes in tear osmolarity over time following instillation of Blink Contacts, an isotonic ocular lubricant

containing hyaluronate. We hypothesized that even in isotonic solution, the water-binding properties of hyaluronate would reduce tear osmolarity. This will help us better understand efficacy of this treatment and develop a rational basis for dosing schedules. Conclusions. We conclude, although hyaluronate binds water, it does not significantly alter tear osmolarity when its osmolarity is similar to that of the tears. However, it may reduce osmolarity when it is more hypotonic relative to the tears. Small sample size, few eyes with hyperosmolarity and limitations of our methods may have affected results.
